Healthcare Wood Finishes – Conversion Varnish

Conversion varnish is an advanced wood coating technology utilized for the most demanding performance environments. As compared to most conventional wood finish technologies, conversion varnish offers many advantages.

Our finish is high solid formulation that is catalyzed as it is sprayed onto the surface. It builds the coating thickness uniformly and ensures complete cross linking in each application step. This formulation includes an anti-microbial additive that protects the surface and inhibits microbial growth. The conversion varnish is enhanced with a UV inhibitor to provide protection from sun exposure and additional product life without fading.

Features and Benefits

- Superior coating strength – High resistance to scratches and corner wear
- Superior moisture resistance – Protects the wood from moisture which may otherwise lead to coating cloudiness or breakdown
- Vastly superior chemical resistance - conversion varnish is not broken down by even the harshest chemicals and cleaners. Things such as alcohol that can quickly breakdown lacquers are impervious to conversion varnish. Typical commercial cleaners are much less of a concern for use on the surface when finished with Conversion Varnish.

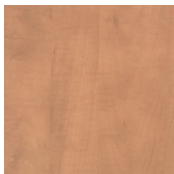

Features and Benefits

- Super adhesion – Means superior performance even in a heavy abuse environment
- Great Surface feel - Properly applied and cured conversion varnish achieves this performance without losing a silky natural hand feel – other technologies (i.e. urethanes) have high performance but end up with unnatural plastic feel to the touch

Finishes

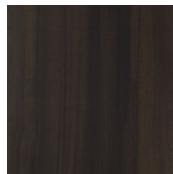

- 18 finishes to choose from, in stock!

Caramel Apple

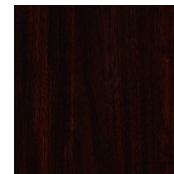

Clark Cherry

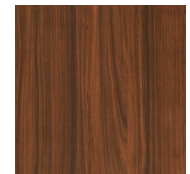

Chocolate Apple

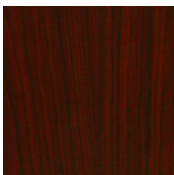

Classic Maple

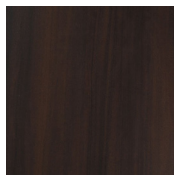

Cocobala

Executive Cherry

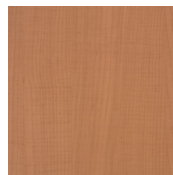

Empire Mahogany

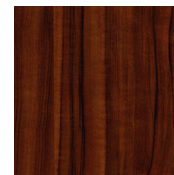

Espresso

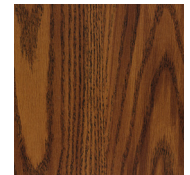

Black

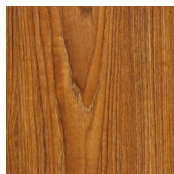

Golden Pear

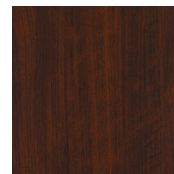

Lewis Cherry
